# LINKING NONFINANCIAL METRICS TO FINANCIAL PERFORMANCE

Christopher D. Ittner EY Professor of Accounting

# Linking Nonfinancial Performance to Financial Results is a Key Component of Managerial Decision-Making

- Forecasting future cash flows from investments in intangible assets
- Choosing projects with the greatest expected financial payback
- Selecting performance measures for evaluating managerial and business performance (for example, measurement dashboards and scorecards)

#### **Some Fundamental Questions**

- What should we be measuring? What are the key <u>drivers</u> of financial success?
- How do we rank or weight the various nonfinancial measures?
- How do you make tradeoffs among different types of measures?
- What are the appropriate performance targets?

#### Some Possible Methods to Address These Questions

- Intuition
- Management consensus
- Measurement frameworks or benchmarking studies
- Informal data analyses
- Rigorous predictive analytics methods

# Performance Measurement Theory Provides a Structure for this Analysis

- Develop an explicit "causal" business model (or "strategy map") describing how value drivers are linked to strategy
- Identify specific value propositions or hypotheses
- Test the hypotheses (and determine whether the model and/or data are adequate)
- Incorporate the results in decision-making models and performance evaluations
- Use the analyses as a learning tool for continually refining strategy, value propositions, and measures

# LINKING NONFINANCIAL METRICS TO FINANCIAL PERFORMANCE

The Steps

#### **Some Fundamental Questions**

- To what extent does the business model incorporate the right drivers of financial success?
- How do you use the business model to allocate resources?
- How do you set targets for the measures?

#### **STEP 1: Identifying the Right Drivers**

- Develop a causal business model that:
  - Is linked to organizational strategy
  - Articulates the key, hypothesized drivers of financial performance
- Construct reliable and valid measures for the key drivers
- Verify the linkages in the business model

### **EXAMPLE:** A Major Fast Food Chain

- Company operates or franchises 6,000+ stores, which offer both in-store purchases and delivery
- Overall profitability was not growing enough to meet either internal or external expectations
- A series of meetings involving senior-level executives from all functional areas produced a consensus business model
- The consensus business model was developed using only management intuition (i.e., without any real data analysis)

#### A Major Fast Food Chain

#### **Consensus Business Model**

### A Major Fast Food Chain

- Employee turnover became the primary measure used for decisionmaking and performance evaluation ("we just know this is the key driver")
- Expensive human resource programs (retention bonuses) were put into place to reduce turnover
- However, subsequent statistical analysis revealed:
  - Stores with same overall turnover, but very different financial performance
  - More profitable stores had <u>higher</u> employee turnover
  - Only turnover among supervisory personnel had any relation to store financial performance

## A Major Fast Food Chain

- Management intuition was only partially correct
- The turnover measure was changed from overall turnover to turnover by employee category
- Further analysis provided an estimate for the financial cost of turnover (and an upper bound for the size of the retention bonus)
- Subsequent studies expanded the analyses to examine the relationships between employee measures, customer measures, and store profitability (i.e., test the bigger business model)

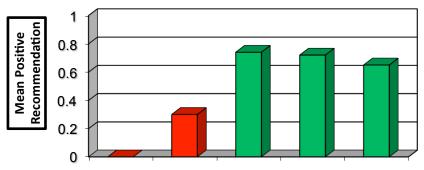

### **STEP 2: Target Setting**

- Common intuition: "More is better"; "100% need to be 100% satisfied"
- Considerable difficulty setting goals for any nonfinancial performance measure
- Difficult to set targets for different measures when no common denominator exists (Is a 10% decrease in customer complaints equivalent to a 3% reduction in defect rates?)
- Non-linear functional relations and tradeoffs among financial and non-financial measures complicate goal setting

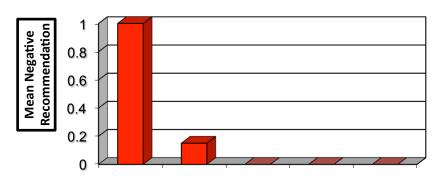

### **An Example: Personal Computer Manufacturer**

- Hypotheses in Business Model:
  - More satisfied customers recommend the company's products to others (positive "word of mouth")
  - Dissatisfied customers complain to others about the product (negative "word of mouth")
  - Greater positive word of mouth increases future financial performance; greater negative word of mouth reduces future financial performance

## **Computer Manufacturer's Recommendation Study**

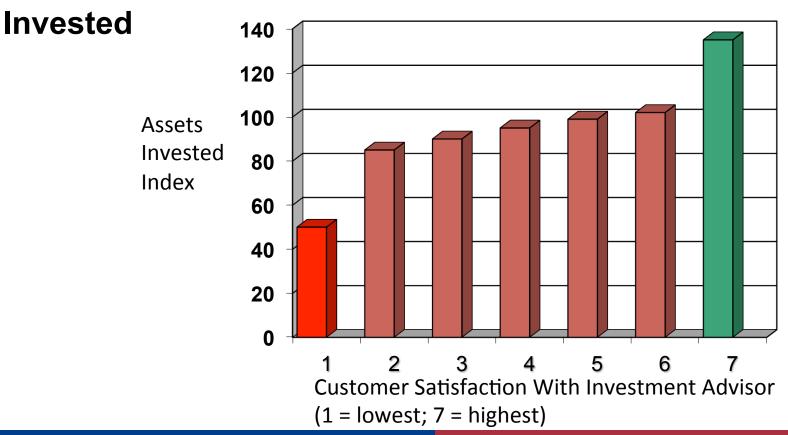

Prior Wave Self-Reported Customer Satisfaction

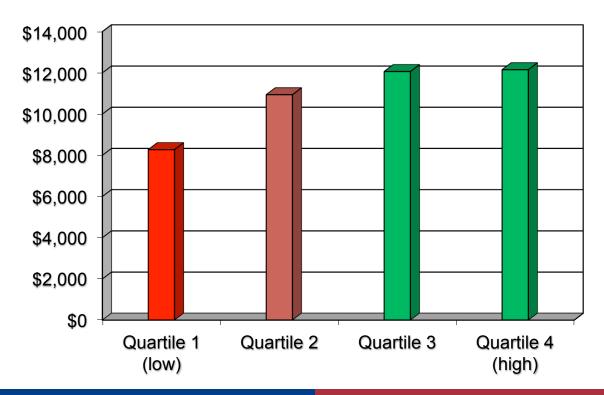

Prior Wave Self-Reported Customer Satisfaction

An Opposite Result: Investor Advisor Rating and Assets

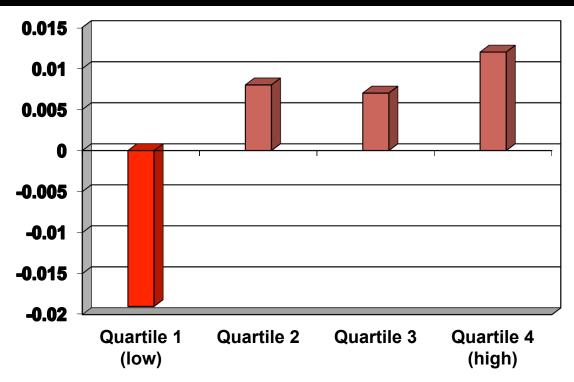

#### **Market Valuation of Customer Satisfaction**

Mean market value (in millions of dollars) impact of American Customer Satisfaction Index Scores <u>after</u> controlling for accounting book value

#### Market Response to Disclosure of Customer Measures

Cumulative ten-day "excess" return following release of ACSI scores

# LINKING NONFINANCIAL METRICS TO FINANCIAL PERFORMANCE

Some Comprehensive Examples

### **An Advertising Organization**

- A hypothesis in the business model:
  - More satisfied customers purchase more in the future (additional sales of same service; upgrade existing services; cross-sell other services)
- Despite considerable expenditures on marketing research, this company had little insight into whether improvements in customer satisfaction ultimately produced increases in future financial performance
- The Chief Financial Officer desired more detailed evidence about whether customer satisfaction should be used for managerial performance evaluation, compensation programs, and corporate strategy

#### **Analysis of Customer Revenue Growth**

Source: Ittner and Larcker, Journal of Accounting Research (1998) -- Data from 2,156 individual customers

#### **Analysis of Customer Revenue Growth**

Source: Ittner and Larcker, Journal of Accounting Research (1998) -- Data from 2,156 individual customers

#### **Analysis of Customer Revenue Growth**

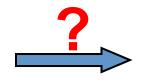

Source: Ittner and Larcker, Journal of Accounting Research (1998) -- Data from 2,156 individual customers

#### **Technology Services Firm**

- Senior management required the marketing organization to demonstrate whether customer satisfaction and other nonfinancial metrics were related to future financial outcomes
- Necessary data were scattered across different functional areas ("data fiefdoms")
- Financial outcomes associated with marketing and quality metrics had never been examined by the company
- There was strong intuition that customer and quality metrics had to be related to financial results ("we just know that it is true")

#### **Approach**

#### **Customer Metrics**

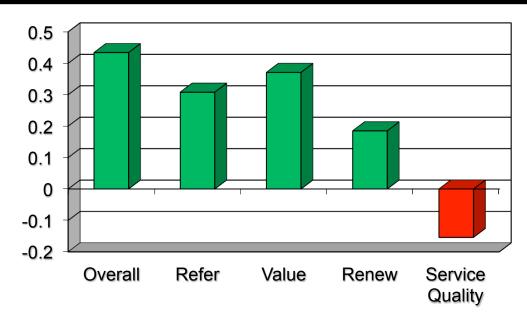

#### Financial Outcomes

- Financial outcomes of interest:
  - Annual revenue growth
  - Clients with an annual revenue growth greater than
     15%
- Operational metric: Composite measure for quality of service
- Customer metrics (measured on a five-point scale):
  - Overall satisfaction
  - Willingness to be a reference
  - Value assigned to service
  - Likelihood of renewal

#### **Analysis of Future Revenue Growth**

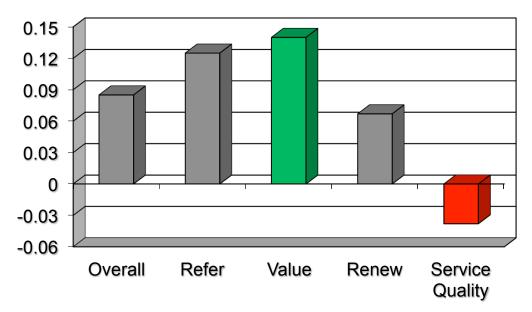

#### Regression coefficient linking customer score and future revenue growth

INTERPRETATION: "One-unit" (out of five) increase in Overall is related to a future increase in annual revenue growth of .434 (or 43.4%)

#### **Analysis of High Future Revenue Growth**

Regression coefficient linking customer score and <u>high</u> future revenue growth

INTERPRETATION: Since the dependent variable is coded as zero/one, the coefficient should be thought of as indicating that increases are moving the client closer to the high growth (> 15%) category

Note: Only the regression coefficient for Value is statistically significant

# LINKING NONFINANCIAL METRICS TO FINANCIAL PERFORMANCE

# Incorporating Analysis Results in Financial Models

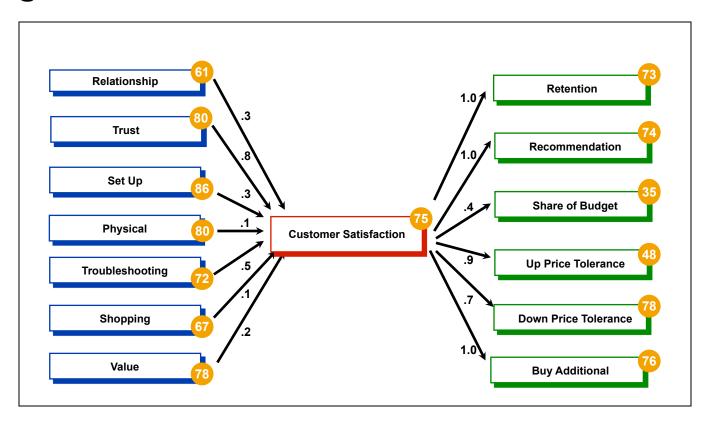

### **Computer Hardware Manufacturer**

- Company is a major supplier of computer equipment to many consumers and businesses
- Senior-level management desired a model to manage and evaluate customer initiatives
- Develop action plans to increase the value of the "customer asset"

#### **Desired Outcomes of Customer Satisfaction**

### Linking Drivers, Satisfaction, and Outcomes

#### **Further Research Revealed:**

- Retention
  - If the retention score was 90 or above (below 90),
     the customer bought the same brand again 56.76%
     (30.77%) of the time -- a change of 25.99%
- Recommendation
  - If the recommendation score was 90 or above (below 90), the customer recommendation resulted in 1.52 (0.87) purchases of the same brand -- a <u>change</u> of 0.65
- Implications:
  - Select action plans to move customer scores over 90
  - Assume that action plans can move customer retention and recommendation scores a maximum of 10.00 points

#### **Focusing on Critical Customers**

## **Expected Economic Value**

# LINKING NONFINANCIAL METRICS TO FINANCIAL PERFORMANCE

# Using Analytics to Choose Action Plans

# Linking Nonfinancial and Financial Results in Broader Business Models

- Examining nonfinancial metrics in <u>isolation</u> of other related metrics is not especially sophisticated and can lead to <u>misleading</u> or <u>incomplete</u> inferences
- A better approach is to develop and test broader business models where:
  - Non-financial metrics (e.g., employee) are related to other non-financial metrics (e.g., customer)
  - Non-financial metrics (e.g., employee and customer) are ultimately related to financial outcomes (e.g., revenues, return on assets, and/or stock price returns)

## **Financial Services Firm Revisited**

#### **Financial Services Firm Revisited**

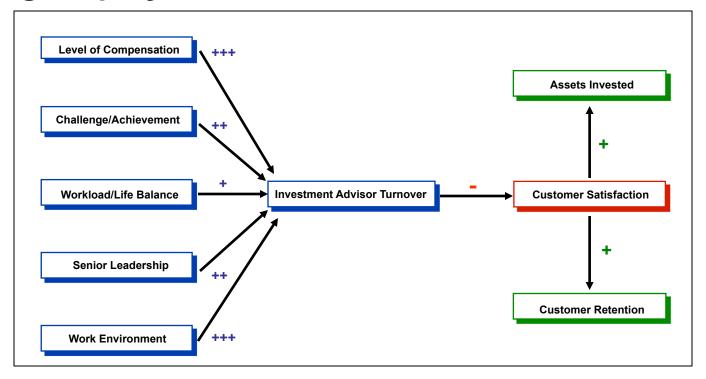

- The firm sought to understand the key drivers of future financial performance in order to:
  - develop their strategy
  - select action plans with the largest expected economic payoffs
- As seen in the analytic analyses, increases in customer retention and assets invested (or under management) had a direct impact on future economic success

 However, the drivers of customer retention and assets invested were not known

### **Customer Satisfaction with Advisor**

- Additional analysis revealed that customer satisfaction with the investment advisor was related to:
  - Trustworthiness
  - Responsiveness
  - Knowledge
- However, the key determinant was <u>investment advisor</u> <u>turnover</u> (i.e., customers wanted to deal with the same person over time)
- Given these results, the company next identified the drivers of investment advisor voluntary turnover

## **Linking Employees to Customers**

Notation: +/- refers to a strong statistical positive/negative link (precise numbers are not reported due to company request)

## **Resulting Actions**

- Level of compensation (e.g., salary and bonus) and work environment (e.g., availability of helpful and knowledgeable colleagues) were the most important drivers of advisor turnover
- These observations were used to develop human resource action plans to reduce advisor voluntary turnover
- These results were also the basis for computing the economic value (expected Net Present Value) of human resource initiatives and the economic value of investment advisors

# LINKING NONFINANCIAL AND FINANCIAL PERFORMANCE

## Organizational Issues

## **Common Reasons for Analysis Difficulties**

- Predictive analytics can provide many benefits—but many companies find it incredibly hard to do
- Insufficient model development
  - No linkages modeled
  - Over-reliance on benchmarking and generic measurement frameworks
- Measures with poor psychometric properties
  - Too few questions
  - Too few scale points (e.g., "top-box")

## **Common Reasons for Analysis Difficulties**

- Measuring the wrong attributes and not understanding the underlying drivers of performance
- Piecemeal analyses
  - Little attempt to comprehensively test intuition or hypotheses
  - "Islands of analysis" and "strategy silos"
  - Lack of resources and appropriate skill sets ("Lots of data but no information")

## **Common Reasons for Analysis Difficulties**

- Data and information system limitations
  - No common identifiers or unit of analysis across measures
  - Inconsistent measurement
  - Systems not integrated
  - Lack of necessary accounting data (e.g., customer profitability)
- Political Issues
  - Data fiefdoms
  - May not match intuition (which makes it wrong)
  - Don't want to know the answer
  - Organizational power issues

## **Key Questions That Need to be Addressed**

- What is the firm's business model? How <u>specifically</u> is the company or business unit expected to create value?
- What data are currently available to test the value propositions? (Try not to reinvent the wheel)
- What are the desired economic outcomes? (revenues, profits, win/loss, retention, etc.)
- What is the appropriate unit of analysis? (office, plant, region, customer, product/service, program/initiative, etc.)
- What organizational mechanisms can be used to ensure ongoing analysis?

## ONLINE
